**INTRODUCTION 1.1** The discipline Soil mechanics is the science of equilibrium and motion of soil bodies. Here soil is understood to be the weathered material in the upper layers of the earth's crust. The non-weathered material in this crust is denoted as rock, and its mechanics is the discipline of rock mechanics.

The soil is supposed to be excavated, the coherence has to be broken. For the determination of cutting forces, power and specific energy the criterion for failure has to be known. In this book the failure criterion of Mohr-Coulomb will be applied in the mathematical models for the cutting of sand, clay and rock.
