Stages of learning. Fitts and Posner 2 proposed a model of skill acquisition that centered on three stages. In their now-classic theory, performance was characterized by three sequential stages, termed the cognitive, associative, and autonomous stages (Fig. 1B). The cognitive stage marks the period in which the task goals are established and used to determine the appropriate sequence of actions ...

Motor Learning and Control: Concepts and Applications

Well, motor learning, particularly early learning, involves attempts by learners to acquire an idea of the movement (Gentile, 1972) or understand the basic pattern of coordination (Newell, 1985). To achieve these goals, learners must use cognitive (Fitts & Posner, 1967) and verbal processes (Adams, 1971) to solve problems.

Donna J. Cech DHS, PT, PCS, Suzanne "Tink" Martin MACT, PT, in Functional Movement Development Across the Life Span (Third Edition), 2012. Summary. Motor learning has occurred when a performance of a motor behavior has permanently changed as a result of practice. The process of motor learning occurs over time and individuals progress through stages of learning, from the stiff, awkward cognitive stage through the expert stage where fluid movement seems to occur automatically.
