Protein structure is the three-dimensional arrangement of atoms in an amino acid-chain molecule. Proteins are polymers - specifically polypeptides - formed from sequences of amino acids, the monomers of the polymer. A single amino acid monomer may also be called a residue indicating a repeating unit of a polymer. Proteins form by amino acids undergoing condensation reactions, in which the ...

Stress-strain analysis (or stress analysis) is an engineering discipline that uses many methods to determine the stresses and strains in materials and structures subjected to forces. In continuum mechanics, stress is a physical quantity that expresses the internal forces that neighboring particles of a continuous material exert on each other, while strain is the measure of the deformation of ...

In an exploratory factor analysis, the decision of how many factors to extract should be based on your interpretation of the underlying relationships of your variables with the latent factor. In other words, a 4 factor solution may explain more of the overall variability, but it may not generate 4 factors that make the most sense theoretically.
